It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                      NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 80 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the condigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 156585;

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                         * NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is a not known and their order in this sequence record is a rubitrary. Where the contigs adjacent to the vector can elaentified, they are labelled with 'clone_end' in the feature table. Some order and orientation information as an tentatively be deduced from paired sequencing reads which have been identified to span the gap between two contigs. These are labelled as part of the same 'fragment_chain' and the order and relative orientation of the pieces within a fragment_chain is reflected in this file. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be

The present sequence encodes a CASB7435 polypeptide. CASB7435 is homologous to a human N-acetylgalactosamine-alpha2,6-sialyltransferase (GaINAc alpha-2,6-sialyltransferase I), which is a candidate gene for synthesis of the syalyl-Tn(s-Tn) antigen, a tumour-associated antigen of colorectal cancers. CASB7435 polypeptides and polypeptides are useful for inducing in vitro immune response in cells from the immune system. The activated immune cells are then reinfused for the treatment of diseases such as ovarian, colon, pancreas, kidney, endometrial or gastric cancer or leukemia. CASB7435 is useful for diagnosing a disease, or a susceptibility to disease, particularly colon cancer in a subject related to expression or activity of CASB7435 polypeptide or polynucleotide. CASB7435 polypeptides and polynucleotides are also useful for treating autoimmune diseases and other related conditions. Novel CASB7435 polypeptides and polynucleotides, useful in diagnosis and as vaccine for prophylaxis, treatment of autoimmune diseases, cancers, particularly ovarian and colon cancer -Claim 27; Page 65-66; 97pp; English.

ACCORTANT TO AACCOSIS encode the human pancreatic cancer associated
proteins, called pancreatic cancer antigens, given in AABS4068 to
AABS4466. The human pancreatic cancer antigens agiven in AABS4008 to
AABS4466. The human pancreatic cancer antigens have cytostatic,
convertine, treatine, cardiant and antilnilammatory activities, and can be used
in gene therapy. The polynucleotide and proteins can be used for
preventing, treating, or ameliorating a medical condition or in assays
for diagnosing a pathological condition or a susceptibility to one in
subject. Binding partners to the proteins and the activity of the
subject binding partners to the proteins and the activity of the
subject. Leat or prevent pancreatic disorders, especially cancer.
C quoists and antagonists to the antigens can be used to design nucleic
detect, treat or prevent pancreatic disorders, especially cancer.
C quoists and antagonists to the antigens can be used to design nucleic
and hybridisation probes that can be used in chromosome mapping, linkage
and diagnostic methods. The proteins can be used to generate antibodies
and diagnostic methods the proteins can be used to generate antibodies
which are used to purify, detect and target the polypeptides, including
both in vivo and in vitro diagnostic and therapeutic methods. The
proteins can be used to treat or prevent neural, immune system, muscular,
reproductive, gastroinfestinal, pulmonary, cardiovascular, renal or
proliferative disorders. AAC99212 to AAC99240 and AABS4467 represent
c gequences used in the exemplification of the present invention.

The invention relates to novel transgenic organisms useful in the production of functional food and drink products for the treatment or production of obesity via the regulation of lipid metabolism. The organisms comprise a polynucleotide encoding a growth hormone fragment capable of stimulating the activity of hormone-sensitive lipase (the key enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key enzyme in lipogenesis). The growth hormone fragment preferably contains at least the disulphide-bonded loop of a mammalian growth hormone (but is not the full-length growth hormone) and is optionally linked to an epitope tag or heterologous fusion protein partner. The transgenic organism may be a microorganism used to produce a fermented product organism may be a microorganism used to produce a fermented product of fink made using methods of the invention are used to modify fat/lean ratio, lipid metabolism or food use in a mammal. In particular, the food or drink products may be used to improve the fat/lean ration of the invention, the human growth hormone (hGH) fragment analogue AOD9604 was expressed in yeast, optionally fused to the FAG epitope (AAB73625).

The present sequence is described as a DNA sequence from yeast in the constitution of the present sequence is described as a DNA sequence from yeast in the constitution of the constitution.
                                                                                                                                                                                                                                                  New organisms containing nucleic acid encoding a growth hormone fragment which modulates lipid metabolism are useful to produce dietary aids for obesity and in the meat production industry -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequences (ABLO1840-ABL16175) and the encoded proteins (AABS773-ABB27072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophilar. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectiodes, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABLIGIT), expressed DNA sequences (ABLIGITG-ABLIGIT), expressed DNA

                                                                                                                                                                This invention describes a novel method for identifying substances which modify activity of hyperpolarization-activated cation channels (HACC), by placing cells which express an HACC in an iso-osmotic sodium ion-free buffer in the presence of a potential-sensitive fluorescent dye, and measuring membrane potential after the addition of sodium ions. The prior art patch-clamp techniques, this invention can be automated, and allows high through put soreening. This sequence encodes the human described in the method of the invention.
Identifying substances which modify activity of hyperpolarization-activated cation channels using fluorescent imaging is useful to identify possible therapeutic pharmaceuticals -

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A cDNA library was prepared in E.coli LE392 cells from mRNA isolated from humn histiocytic leuksemia cell line TYH. Plasmids isolated from humn histiocytic leuksemia cell line TYH. Plasmids isolated from the library were introduced into strain KJM-1. Transformants which became resistant to Ricinus communis 120 lectin were selected and found to contain a 1.9kb CDNA fragment. The "lectin-resistance gene" (LEC) was subcloned and sequenced. The deduced amino acid sequence corresponding to the open reading frame had a structure common to glycosyltransferases. The LEC gene was found to encode alpha2-3 sialyltransferase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant alpha 2-3 sialyl-transferase - useful for modification of glyco-protein(s) and glyco-lipid(s) to ensure correct physiological activity
                                                                               Human alpha2-3 sialyltransferase gene from cell line TYH.

The sialyltransferase (SST) is useful as an agent for introducing objogsialize acids such as dir, tri- or tetra sialle acids into proteins, glycoproteins or glycolipids. It can be used in the treatment of hereditary diseases which involve the lack of enzymes needed for the blosynthesis of specified sugar chains. It can also be used for the prevention of cancercus metastasis, meturation of sperm, inhibition of inflammatory reactions or regeneration and reactivation of nervous tissues. This extracellularly releasable sialyltransferase comprises the active domain of the sialyltransferase described in AAW05300.
isolated sialyltransferase enzyme - useful for treating e.g. editary diseases, cancer metastasis, inflammatory reactions or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                The present invention relates to methods for the preparation and use of internal controls for nucleic acid amplification assays. The internal controls a synthetic nucleic acid made by non-recombinant techniques. The internal controls are useful for detecting nucleic acids in a sample such as blood, spinal fluid, semen, saliva, tears, cell culture fluid, recombinant cells, animal tissue or plant tissue, by a quantitative PCR assay, by adding the internal control to the sample, amplifying the nucleic acids in the sample and detecting the amplified products. The internal controls help in performing the nucleic acid amplification assay quickly, and inexpensively without sacrificing assay specificity or sensitivity. The present sequence is one such internal control, which was used in an example to illustrate the present

It is provided in a specification relating to method for decreasing the content of N-acetyllactosamine repeated structure in the sugar chain of a glycoprotein or a glycolipid produced by a cell. The intracellular expression of the sialate transferase gene is increased, and the relative activity of SiaT to the activity of beta-1,3-N-acetylglucosamine

The invention relates to novel genes (ABAl1004-ABA21534) and proteins (ABBL4608) useful for preventing, treating or ameliorating candidations e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful and ovarian cancer and other cancers of the adrend gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allerafies, autoimmune harmody. Addison's disease, allerafies, autoimmune characters e.g. Addison's disease, allerafies, autoimmune characters e.g. Addison's falsease, allerafies, autoimmune characters e.g. Addison's falsease, allerafies, autoimmune characters e.g. Addison's falsease, allerafies, autoimmune characters e.g. Addison's disease, allerafies, autoimmune characters e.g. Addison's disease, allerafies, autoimmune characters e.g. Addison's falsease, allerafies, autoimmune characters e.g. Addison's disease, allerafies, autoimmune characters e.g. Addison's disease, allerafies, autoimmune characters e.g. Addison's diseases, allerafies, autoimmune characters e.g. Addison's diseases, allerafies, autoimmune characters e.g. Addison's diseases e.g. carebral anoxia and epilepsy; and (f) infections.

(d) wound healing; (e) neurological diseases e.g. carebral anoxia and end parasitic infections.

(b) the sequence data for this patent did not form part of the content of the printed specification, but was obtained in electronic format directly contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó;

                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention inseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectiofides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABB10170.), and the encoded proteins The invention sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from brosophila and for elucidating cell signalling and cell-cell interactions -

                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                             AAQ82869/R65240 are the nt and AA sequence of porcine Gal beta 1,3 Gal NAc alpha 2,3 sialyltransferase ("alpha 2,3"). The nt sequence of the porcine alpha 2,3-0 mRA was determined from DNA sequence analysis of two overlapping clones, lambda ST1 and lambda ST2. The proposed signal anchor sequence and glycosylation sites are indicated in FT. The sequence corresp. to the long form of the alpha 2,3 sialyltransferase, econcided by overlapping clones lambda ST1 and lambda ST2. A DNA isolate which encodes porcie ST30 sialyltransferase and an essentially pure porcine ST30 sialyltransferase are claimed.

                                                                                                                                                                                                               Human Gal beta 1,3GalNAc alpha 2,3 sialyltransferase is also called human ST30. In order to clone human ST30 sialyltransferase two degenerate oligos were synthesised (AAGQS180 & AAGQS181). For PCR amplification, first strand cDNA synthesised from human placenta or human fetal brain total RNA was combined with each primer. 8/50 clones obtd. from human placenta were judged to contain the human ST30 sialylmotif as judged by homology with the porcine sequence. A human placenta cDNA library was screened with the cloned PCR fragment. Characterisation of the positive clones revealed cDNA of two types which differed in their 5' ends. The nt shown in AAG82873. -37 and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a

The present invention describes primer sets for synthesising 5602
[ull-langth count of the Specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide comprises at least 15 nucleotides, or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence is selected from those defined in
the specification. The primers are useful for synthesising polynucleotides,
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
chection and/or diagnosis of the abnormality of the full-length
conna and/or diagnosis of the abnormality of the full-length
conna and/or specialised methods. Anio3166 to AAH13632
AAH13633 to AAH18742 represent human amino acid sequences; and AAH13629 to AAH13632
crepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     454 gagatagatcgatcctcctgcatttggagaatgaacaatgccccaccaaaggtta-tga 512

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM; Barash SC, Rosen CA,

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietlc antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 32987; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) colynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the proteins and polynucleotides may be used to prevent.

C protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic related diseases, especially cancers and cancer metastases of haematopoietic derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK87650 and AAM82169 cepresent sequences used in the exemplification of the present invention.

Sequence 21521 BP; 6512 A; 4334 C; 4422 G; 6253 T; 0 other;

                                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42313) with noctropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheiner's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, Activitianis nor has: Immune system suppression, Activitinhibin activity, chemotactic/chemokinetic activity, hemocactic/chemokinetic activity, and as and thrombolytic activity, and inflammation, leukaemias and CN. The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, according and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, Activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and Nofe: The sequence data for this various and inflammation, leukaemias and Nofe: The sequence data for this various and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        394 tgtgacctttgtgccatagtgtcaaactcaggtcagatggttggccagaaggtgggaaat 453

The human secreted proteins given in AAB08891 to AAB08984. The human secreted proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; anti-proliferative; immunosuppressive; antibacterial; and vulnerary. The secreted proteins and their related polynucleotide sequences are useful for diagnostic and therapeutic methods useful for diagnosing and treating confers related to the secreted proteins. The proteins, and confered sequences may be useful for treating disorders of the immune system, hyperproliferative disorders, infectious disease, regeneration of tissues, for chemotaxis and for screening molecules that used as food additives or preservatives, to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, co-factors or other nutritional components. Agonists or antagonists of the proteins and bypervascular diseases. AAA39031 to AAA39051

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AA160300
```

DNA encoding protein of the invention #17.

Gurney AL;

```
primers for PRO polypeptides of the invention. The sequences of the primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of comparing the level of expression of a PRO polypeptide in a test sample of comparing the level of expression in the test sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, carvical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                             Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tgtgacctttgtgccatagtgtcaaactcaggtcagatggttggccagaaggtgggaaat 453

Secreted and transmembrane proteins and nucleic acids designated PRO, useful as hybridization probes, in chromosome and gene mapping and gene therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fong S;
Hillan KJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       394 tgtgacctttgtgccatagtgtcaaactcaggtcagatggttggccagaaggtgggaaat 453

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ή;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaccutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                              New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    394 tgtgacctttgtgccatagtgtcaaactcaggtcagatggttggccagaaggtgggaaat 453

The present invention describes primer sets for synthesising 5602

(111-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dr primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

the 5602 nucleotide sequences defined in the specification, where the

colligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprises a 1'-end sequence, where the

coligonucleotide which comprises a 3'-end sequence of in

plynucleotide which comprises a 3'-end sequence, where the

coligonucleotide comprises a 1'-end sequence, where the

coligonucleotide comprises a 1'-end sequence, where the

coligonucleotide comprises a 1'-end sequence, where the

coligonucleotide of the primer sets can be used in antisense therapy and

the specification. The primer sets can be used in antisense therapy and

coligonucleotide comprises and the antisense therapy and

coligonucleotide which cDNAs. The primers are also useful for the full-length

colnAs easily without any specifialised methods. AAH03616 to AAH13628 and

AAH13633 to AAH18742 represent human cDNA sequences; AAH3629 to AAH13632

collagonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the present invention.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; cortopathic; antiparkinsonian; nootropic; neuroprotective; cortopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaquilant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; cardiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; proteins and intianeemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy celors; The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft wishost disease, cardiovascular disease, diabetes mellitus, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficlency (SCID), AIDS, viral, alterative, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system, such as peripheral nervous system diseases, such as Alzelmer's Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Draqer Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, extivity, chemotactic/chemokinetic activity, chemotactic/chemokinetic activity, damotactic/chemokinetic activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed

           AAK78174;
 The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)spanists are useful.

The nucleic acids, proteins, antibodies and (ant)spanists are useful.

In the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases uch as wycardial ischaemias; epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.WiPo.inf/Published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                      Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   377 agcetttgcaactggactgtgacetttgtgccatagtgccaaactcaggtcagatggttg 436

                                                                               The present invention relates to an isolated nucleic acid comprising a thoricacide sequence coding for a full-length mammalian GM3 synthase or their biologically active polypeptide fragment. It is also useful as a size marker in nucleic acid or protein electrophoresis or chromatography and for detecting expression of sialyltransferase (ST) in whole organs, tissue or cells. The nucleic acid probes can also be used to detect, quantitate or isolate a mammalian sialyltransferase nucleic acid in a test sample or to identify sialyltransferase homologues, as oligonuclectide probe e.g. in polymerase chain reaction differential display, in combination with cDNA libraries, expression libraries, etc. The nucleic acid can be modified to make it resistant to cellular enzymes, oxidation, reduction, nucleases, etc. Or to enhance its uptake into cells. The present sequence is human sialyltransferase, 78T6 Gal V
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; nootropic; neuroprotective; cytostatic; dermatological; virucide; immunosuppressive; antilaflammatory; anti-Hry; antibacterial; vulnerary; antiparkinsonian; antisickling; antianaemic; antiaritric; cancer; antirheumatic; hepatotropic; cerebroprotective; antiinflammatory;

                                             The polynucleotide sequence given in AAA78881 to AAA78432 encode the human secreted proteins given in AAB24437 to AAB24604. Human secreted human secreted proteins given in AAB24437 to AAB24604. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; antianaemic; antidabetic; antihlammatory; ophthalmological; antitheumatic; antiantritic; antipsoriatic; antimicrobial and antiparkinsonian.

Human secreted protein polynucleotides, polypeptides, antagonists and/or agonists may be useful in treating, preventing, and/or diagnosing other disorders and/or conditions such as: (a) cancers; (b) disorders of the immune system; (c) anglogenesis disorders; (d) disorders of the immune system; (e) cardiovascular disorders; (f) diseases associated with increase apoptosis; (g) neurological diseases; and should also used to promote wound healing.

AAA78372 to AAA78380 and AAB2446 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  512

The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, immunosuppressent and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous flocalised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and CNS disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed

invention have hydrophobic domains and can be used for the treatment of various immune deficiencies and disorders, such as severe combined immunodeficiency (SCID), multiple solerosis, rheumatoid arthritis, autoimmuno pulmonary inflammation, graft-versus-host disease and Guillain-Barre syndrome. The proteins may also be useful in the treatment of allergic reactions and conditions, such as asthma and in regulation of allergic reactions and conditions, such as asthma and in regulation of utility in compositions used for bone, cartilage, tendon and/or nerve trissue growth or regeneration as well as wound healing and in the periodontal disease and in other tooth repair processes. Other uses include treatment of turnons. The proteins may be used in the treatment of periodontal disease and in other tooth repair processes. Other uses in cludde treatment of thrombolytic and haemostatic conditions, treatment or prevention of tumours and inhibiting infection by bacteria, viruses, fungi and other parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        agttggtatctatccgaatgcccaaatatacgtgaccacagagaagcgcatgagttactg 752

This sequence represents human cDNA encoding a secreted protein. The invention relates to sequences AAA87725-A87774 which encode human secreted proteins AA82763 = B12812. The proteins include signal peptides. Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the secreted proteins. Also contained in the invention are methods for storing the sequence data on a computer system, and a method for identifying features of the cDNA sequences using a computer programme. The cDNAs may also be useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted proteins. The cDNAs may also be useful in diagnostic, forensic, gene therapy and chromosome mapphing procedures and may be used to design expression vectors and secretion vectors. The proteins of the invention may be used to treat diseases including cancer, autoimmune diseases, cardiovascular disorders, cystic fibrosis, hypothyroidism, immunological disorders, obesity, mitochondriocytopathies, diabetes, atherosclerosis, neurodegenerative disorders, graff rejection, Alzheimer's disease, consurodegenerative disorders, and in the consultation of the 
                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; forensic procedure; gene therapy; chromosome mapping; cancer; autoimmune disease; cardiovascular disorder; cystic fibrosis; hypothyroidism; immunological disorder; amyloidosis; brain disorder; skeletal muscle disorder; eye disorder; obesity; mitochondriocytopathy; diabetes; atherosclerosis; Alzheimer's disease; neurodegenerative disorder; graft rejection; dementia; hyperlipidaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotides and polypeptides encoding proteins with signal peptides, useful in diagnostic, forensic, gene therapy and chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1556 BP; 287 A; 521 C; 460 G; 288 T; 0 other;

The present invention relates to human proteins (AAB61608-AAB61617) and their coing sequences (AAF28679-AAR28698). The proteins of the present invention have hydrophobic domains and can be used for the treatment of invention have hydrophobic domains and can be used for the treatment of various immune deficiencies and disorders, such as severe combined ammunodeficiency (SCID), multiple sclerosis, rheumatoid arthritis, autoimmune pulmonary inflammation, graft-versus-host disease and call farmed arthritis, autoimmune pulmonary inflammation, graft-versus-host disease and call farmed or allergic reactions and conditions, such as asthma and in requibition of allergic reactions and conditions, such as asthma and in regulation of the second the second or allergic reactions used for bone, cartilage, tendon and/or herve treatment of purns. The proteins may be used in the treatment of purns in other tookn repair processes. Other uses include treatment of thrombolytic and haemostatic conditions, treatment or prevention of tumours and inhibiting infection by bacteria, viruses, conditions and conditions.

The present cDNA sequence encodes a human carbohydrate-modifying enzyme (CME). CME polynucleotides and polypeptides are useful for treating and diagnosing diseases associated with CME such as diabetes, autolimune/Anflammatory disorders such as ADS, Addison's disease, adult respiratory distress syndrome, allergies, anaemia, asthmat atheroclerosis, autolimune thyroiditis, bronchitis, cholocystitis, contact dermatitis, Crohn's disease, emphysema, erythroblastosis fetalis, glomerulonephritis, Good pasture's syndrome, gout, Grave's disease, Hashimoto's thyroiditis, multiple sclerosis, myasthenia gravis, costedarthritis, osteoporosis, pencreatitis, polymyositis, psoriasis, Reiter's syndrome, arthritis, scleroderma, sjogren's syndrome, complications of cancer, hemodialysis, and extracorporeal circulation, complications of cancer. CME, or protozoal, and helminthic infections, trauma, or cancer. CME, or its catalytic or immunogenic fragment, is useful for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   393 ctgtgacctttgtgccatagtgtcaaactcaggtcagatggttggccagaaggtgggaaa 452

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human proteins with hydrophobic domains, useful for the treatment of immune disorders, tumors, allergic conditions, thrombosis and microbial infection -
